

SCRS Global Oncology

Oncology Education Workstream Meeting Summary October 2021

The team spent this meeting covering two main points. The first was finalization of the scope of work statement and secondly, the next phase of work that constitutes breakout groups diving into each of the individual focuses that will comprise the bulk of the work: personnel, logistics and infrastructure, feasibility and start-up, and regulations. The scope of work was quickly reviewed for any final details that were missing but is now considered a final document that will serve as a guide for the remaining work on the four areas.

After discussion around what the plan is thus far for these groups, the team agreed that we would separate the team into two working groups. One group will focus on personnel and logistics/infrastructure, while the other focuses on regulations and feasibility/start-up. This allows specialization into operations focused topics, and procedural focused topics. It was also noted that the global landscape regarding the regulation topic is broad and large, so the emphasis will be placed on high-level information and guidance so that those interested can go to other sources for more specific information.

At the next meeting in early December, the team will be divided into groups per the above and diving into the subject areas. The first part of this exercise will constitute level-setting the team against the scope of work and what, in the form of an outline, will be part of each of these two groups to develop and work on. They will set goals and expectations for the work and begin to use the information previously discussed as a place to begin this outlined work. From there, they will develop-out the items they create as part of this framework.
